The whole thing was then disassembled and sanded and stained. There is a myriad of colours from which to choose all of which will highlight the grain beautifully. I decided on marine varnish as a finish.

Paints, adhesives and the other fluids were then added. Baring in mind that I had an issue with weight (the box, not my own!), I had to think up a method of storing paints, adhesives, and other fluids. And so the idea of using Velcro strips came to mind. By Placing strips horizontally on the inside of the side, S2., and the corresponding strips cut to appropriate lengths and fixed to the various items that I needed to store, I was able to conveniently and securely store all these items. Lastly a cutting mat was fitted.

To the outside of the box I placed 8 anti-scratch pads, 4 on the front/ work surface and 4 on the bottom of the box. These are available from most hardware stores
