

The measurements and design are completely flexible thus my *WorkShox* can be built for any purpose.

The down side of this project is that, while ignorance is bliss, the size of the box does not allow for ease of pick up. It would have been better if I had planned some sort of handle on each side but thankfully I am still able make these additions.

Now I have a suitable work station within the house. It can be set up in a couple of minutes and closed up just a fast.

Of course I now have a storage problem for my creations. And I've just discovered 1/6<sup>th</sup> scale!

Where is The Enterprise with it's 'holodeck'?
